

Code Clash User Manual Document

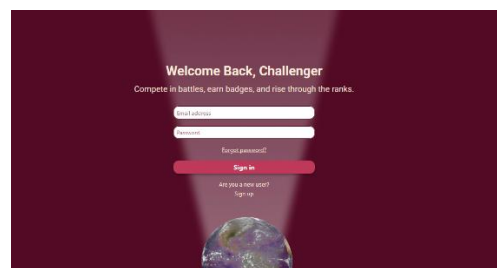

CodeClash

Code Clash is a math and programming battling platform that allows users to play against other users to test and practise their mathematical and programming skills.

Upon entering the Code Clash website users will be prompted to either sign up for the platform if they haven't signed up and created a user before, or to sign in, if they have created a user before.

After either creating a user or logging in, users will enter their personal dashboard page that shows their stats like their ELO (their score), which starts off at 600. In order to increase their ELO users need to enter Ranked matches with other players. If they lose these matches however, their ELO will decrease. Code Clash offers users two game category options, Ranked and Casual. Both allow users to battle against other users in a similar ELO range, however Casual Play allows users to simply practise their skills in a lower-pressure environment. This can provide more opportunity for users to take the time to understand their weaknesses and strengths in certain fields. Ranked Play is the competitive game mode that allows users to improve their ELO or worsen it depending on the outcome of the match. As the user's ELO increases, they will be able to join different leagues of increasingly advanced concepts.

Option to Choose Between Ranked and Casual Play on a User's Personal Dashboard Page

After entering a match, users have to race against the clock and their opponent to answer the questions provided. Users, if in a Math match, can choose to provide their working. They must then provide their final answer in the answer box, after which they need to Submit it to advance closer to winning the match. It is the same for a Programming match except working can't be recorded in the same way. After the match users are displayed stats like how much ELO was won or lost by them and their opponent.

From the dashboard the user may also access other features such as being able to see their Winning Streak and any recent achievements/badges they may have been awarded thus far as well as their skill progression in both mathematics and programming.

From the side navigation bar, users are able to navigate to find their Match History, which displays a history of their matches as well as information about these matches, like who won, how much ELO was gained or lost by each party and which questions were answered incorrectly and what the correct answers and methodology to solve them are.

Additionally, the side bar allows users to find and participate in tournaments, view the top players in their league on the leaderboard and where they rank comparatively, all their achievements and badges, their friends - whereby after navigating to this tab they are able to request a casual match with said friends and finally, the help menu which contains a more extensive Game Guide that explains Code Clash in even more depth.
